

This eight (8) hour block of instruction takes Tactical Emergency Casualty Care from the classroom, into an austere environment. Participants will learn tips, tricks, and techniques on performing life-saving TECC measures within the confines of a rescue vehicle. This block will also provide participants with an array of considerations when formulating extraction plans using armored rescue vehicles, and treatment of injured personnel within the armored vehicle itself. Additionally, instructors will discuss possible tactics used during extraction, lift techniques, and go hands-on with downed-officer rescues under simulated direct threat situations.
